PROJECT TITLE	Strategic Product Placement Analysis using Tableau
MAX MARKS	4 MARKS

2.3 – Brainstorming

Strategic Product Placement Analysis is about finding the best ways to place products so they are easily seen grab customer attention and boost sales.

The process starts with brainstorming and thinking about the things that affect how customers make buying decisions.

These factors include:

- Where the product is located in the store

Strategic Product Placement Analysis using Tableau

- How much the product costs
- Any. Discounts that are available
- Who the customers. What they like
- How foot traffic the store gets

By looking at these elements businesses can figure out which products do well in locations and how the way a store is laid out affects how customers behave.

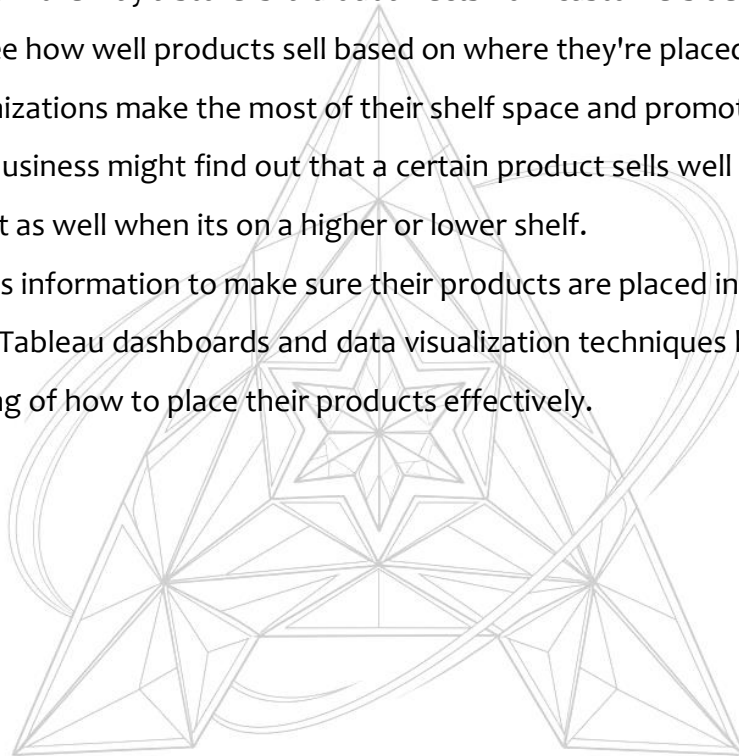

They can also see how well products sell based on where they're placed.

This helps organizations make the most of their shelf space and promotional activities.

For example a business might find out that a certain product sells well when its placed at eye level but not as well when its on a higher or lower shelf.

They can use this information to make sure their products are placed in the spots.

Using tools like Tableau dashboards and data visualization techniques businesses can get an understanding of how to place their products effectively.
