3.3 – Data Flow Diagram

Here is the data we need to collect.

Strategic Product Placement Analysis using Tableau

- We have to get the product placement data and the sales records.
- We also need the customer information and the foot traffic data.
- To get the data ready we have to clean it and prepare it.
- This means we have to remove any duplicates and handle any values.
- We also have to standardize the formats so everything's the same.
- After that we have to store the data.
- We will save the processed data in a database so it is easy to find.
- Now we have to analyze the product placement.
- We will compare the shelf positions. Identify the locations that are doing well.
- We also have to analyze the sales performance.
- This means we have to calculate the revenue and sales trends and measure the impact of the product placement.
- We also need to analyze the customer behavior.
- We will study the buying patterns. Segment the customers.
- We have to analyze the foot traffic
- This means we will identify the high-traffic zones and correlate the traffic with the sales.
